Declaration of Originality

I declare that this project is all my own work and has not been copied in part or in whole from any other source except where duly acknowledged. As such, all use of previously published work (from books, journals, magazines, internet etc.) has been acknowledged by citation within the main report to an item in the References or Bibliography lists. I also agree that an electronic copy of this project may be stored and used for the purposes of plagiarism prevention and detection.

Statement of copyright

I acknowledge that the copyright of this project report, and any product developed as part of the project, belong to Coventry University. Support, including funding, is available to commercialise products and services developed by staff and students. Any revenue that is generated is split with the inventor/s of the product or service. For further information please see www.coventry.ac.uk/ipr or contact ipr@coventry.ac.uk.

Statement of ethical engagement

I declare that a proposal for this project has been submitted to the Coventry University ethics monitoring website (https://ethics.coventry.ac.uk/) and that the application number is listed below (Note: Projects without an ethical application number will be rejected for marking)

1 Abstract

2 Introduction

One of the major causes of eye vision loss is diabetes. While delayed examination would have a higher effect on the retinal area of the eye, early detection of diabetes is crucial. ## Background to the Project

2.1 Project Objectives

2.2 Overview of This Report

3 Literature Review

A model to identify diabetic retinopathy at an earlier stage has been developed by a number of researchers.

4   Methodology

4.0.1   *Dataset*

For this research project I'm using dataset available at Kaggle("Diabetic Retinopathy Detection" 2015). This Retinal images were provided by EyePACS. The dataset containing large set of high-resolution retina images taken under a variety of imaging conditions. For each image, a left and right field is provided. Images are identified by a image id and either the left or right eye (for example, 1 left.jpeg represents the patient number 1's left eye).

Table 2: ("Diabetic Retinopathy - Stages" 2017)

| DR classes	Level	Description
No DR	0	Healthy Retina (Normal)
Mild	1	Retina with tiny bulges (microaneurysms)
Moderate	2	Retina with microaneurysms, higher risk of developing vision problems in the future
Severe	3	Retina with severe and widespread microaneurysms, including bleeding into the retina
Proliferative	4	New blood vessels and scar tissue have formed on your retina, which can cause significant bleeding and lead to retinal detachment
Figure 1: Normal Retina Vs Diabetic Retinopathy Retina ("Diabetic Retinopathy Vs Normal," n.d.)

4.0.2   *Data pre-processing*

Image pre-processing was performed with the aim to decrease unclear image and reduce image size. The plot below illustrates the class imbalance in the original dataset.

The dataset consist of 35,126 set of images. The orginal image have 1944 * 2592 * 3 size, and all images are jpeg format. The classes have an uneven distribution of images.
Figure 2: Sum of number of records for each level

1. Image Resizing

   Due to the enormous size of the dataset, it was drastically downsized before being sent to the network. Each input image is 256 * 256 in size after resizing.

2. Removing Unclear Image

   Some images have a blackish or white tint. Because it might affect the outcome, this type of image cannot be fed into the network. The removal of an unclear image is a crucial step that must be taken.

3. Dividing images into classes

   Images are classified into 5 folders based on the DR levels.

5   Requirements

6   Analysis

7   Design

8   Implementation

9   Testing

10   Project Management

10.1   Project Schedule

10.2   Risk Management

10.3   Quality Management

10.4   Social, Legal, Ethical and Professional Considerations

11   Critical Appraisal

12   Conclusions

12.1   Achievements

12.2   Future Work

13   Student Reflections
